

Exo 1

1) $f: \text{int} \rightarrow \text{int} \rightarrow \text{int} * \text{int}$
 $s: \text{int}$

2) $g: \text{int} \rightarrow \text{float}$
 $gl: \text{liste de float} \rightarrow \text{float}$

3) $h: \text{func} \rightarrow \text{liste de int} * \text{string} \rightarrow \text{liste de string}$
 $z: \text{liste de string}$

Exo 2

1) $\text{let rec } f_i_a \text{ func } i \ j \ \text{acc} =$
 if $i > j$ then
 acc
 else if $(\text{func } j) = \text{true}$ then
 $f_i_a \ i \ (j-1) (j::\text{acc})$
 else
 $f_i_a \ i \ (j-1) \ \text{acc}$

$\text{let } \text{filter_int} \ \text{func } i \ j =$
 $f_i_a \ \text{func } i \ j \ []$

2) type op = Del | Dup | Nop

let rec apply-op lv lo =

```
match lv, lo with
| [], [] → []
| [], _ → failWith "error"
| _, [] → failWith "error"
| vi::llv, oi::llo →
  let res apply-op llv llo in
  match oi with
  | Dup → vi::vi::res
  | Nop → vi::res
  | Del → res
```

3) La fonction n'est pas récursive terminale car à la fin on ne propage pas le résultat, on appelle la fonction g avec le résultat de f.

4) f: (fun 'a -> 'a -> 'a) -> 'a list -> 'a

Exo 3

1)

```
let pz-coord c =
  match c with
  | Tel (v) → Printf.printf "tel: %s\n" v
  | Email (v) → Printf.printf "email: %s\n" v
  | Social (v) → Printf.printf "social: %s %s\n"
    (fst v) (snd v)
```

```
let pz-contact c =
  Printf.printf "%s %s\n" c.prenom c.nom
  let() = if c.favorit = true then Printf.printf "Favorit\n" in
  List.iter (fun x -> (pz-coord x)) c.coords
```

```
3) let pr-carnet car =  
    list.iter (fun x -> (pr-contact x)) car
```

```
4) let contact-max-coords car =  
    let f a x =  
        if (list.len (a.coords)) < (list.len (x.coords)) then  
            x  
        else  
            a  
    in  
    if list.len car = 0 then failwith "error"  
    list.fold-left f (list.hd car) car
```

(4 => sqrt) |> int_of_float
